

## RPM Update Software

Update or Install software with:

```
[root@system ~]# rpm -U httpd-2.2.15-15.el6.centos.i686.rpm
```

Be careful with this!

Only update if installed:

```
[root@system ~]# rpm -F httpd-2.2.15-15.el6.centos.i686.rpm
```

This is really an update!

Changed configuration files are  
installed as **xxx.rpmnew**.

Better use **yum update**.
